

Dec. 16, 1923.

Sabin

My dear Mrs. Denison,

The towels came before your letter and I said to myself, how did Mrs. Denison ever find such linen as that these days; I know that there is none like it to be had in Baltimore. Then the card explained. I shall surely enjoy them. They make it a joy to wash dishes. The first little breaks are just beginning to come in the others you gave me and I was mourning them. Thank you very much. As you know I shall prize them especially for the old Lake Geneva days.

This is Sunday and as I drove over I kept thinking how fine it is to have Susan B. She's a real joy, doesn't mind a cold morning a bit. And she is a real help in my work. Things have gone better than I dreamed this fall. We have two nice things practically done. One of them is the first of our real physiological studies on blood. We have been studying the effect of transfusions of blood on rabbits and have confirmed my original theory that the form of the cell I discovered last year is the stimulus for producing or rather for calling out the new blood cells from the marrow. We have showers of these cells in the circulating blood after transfusion which occur just before the numbers of new cells shoot up. This is the kind of work that must underlie the study of leukemia. Then I have had a wonderful case of leukemia which I was asked to see at the Hebrew Hospital where one of our graduates is director. I reversed their diagnosis and have made some very interesting observations on the case. The whole thing opens up so many things to do that I feel thrilled all the time. Three of us are working together, Dr. Cunningham, Dr. Doan and I. The experiments are so complex that it takes three of us and a technician to do them. All this makes it very hard for me to decide whether to go to the Rockefeller next

year or not. I am rather inclined to stay here another year, and then consider taking a pure research position instead of going on with the teaching. This work is so very interesting that more and more I want my whole time for it and feel more and more like turning the teaching <sup>over</sup> to younger people. I don't quite know. Its a hard decision to make. But to come back to the car, our experiments are long and very fatiguing. I get here at the laboratory about eight in the morning and drive at it hard all day until half past five or six and its pretty nice to have the car to go home in instead of the long street car ride. When we both have to be here early I go out for Dr. Cunningham. Then when the autopsies come at night on the cases I have studied at the hospital its pretty nice to have the car to come over in. I never realized how nice it would be to have one much as I have longed for one. It more than comes up to my expectation. I am willing to admit that a Franklin may not be the car for hard mountain climbing, but its great for city work.

Was Mary more hurt in her accident <sup>more</sup> than she let on to me. I was a little perplexed at her letter, she didn't write about it for a week.

Affectionately,

Florence Sabin

Merry Christmas &  
Happy New Year
